Languages

Persian: Native

English: Fluent (Technical)

Professional Approach

7 years of software engineering & backend

Designing distributed and scalable architectures

Engineered security down to the deepest layer (WebSocket)

Delivering complete, production-ready solutions

Deep learning, always up-to-date in the .NET ecosystem

Professional Summary

Backend developer with 7 years of hands-on experience designing and implementing distributed, scalable, and enterprise-grade systems on .NET. I am currently pursuing a B.S. in Software Engineering, but what I deliver in practice goes beyond the degree: an engineering mindset for solving complex problems across multiple layers. HTTP feels entirely effortless to me, and I know WebSocket down to the protocol and security level. I have implemented Clean Architecture, Microservices, load-balancing algorithms, and end-to-end security – from API down to the socket – in projects such as SupportPulse. I learn, design, and deliver fast, and I always stay one step ahead of the .NET ecosystem.

Technical Skills

Category	Technologies
Backend	.NET 10, ASP.NET Core (MVC, Web API, Minimal API, Razor Pages, Blazor WASM), SignalR, gRPC
Distributed Systems	RabbitMQ, MassTransit, API Gateways, Aggregators, Microservices patterns
Databases	SQL Server (EF Core, raw SQL, Stored Procedures), PostgreSQL, MongoDB(a bit) , Redis
Architecture	Clean/Onion Architecture, CQRS + Mediator, Microservices, DDD (fundamentals)
DevOps	Docker, Docker Compose, Git, CI/CD, Kubernetes (learning)
Frontend (auxiliary)	HTML5, CSS3, Bootstrap 5, vanilla JavaScript

Selected Projects

- **Project Name:** SupportPulse
- **Technologies:** .NET 9, ASP.NET Core MVC, SignalR, EF Core, SQL Server, Docker
 - Complete rewrite of administrative operations (role management, user control, chat locking) as an event-driven, real-time system on SignalR – without a single page refresh.
 - Designed an intelligent chat-distribution engine with a weighted algorithm, decoupled request handling from processing using Channel, and eliminated race conditions with SemaphoreSlim.
 - Implemented a Zero-Trust architecture on WebSocket with four security filter layers: Nonce (anti-replay), SecurityStamp (instant session invalidation on role change or ban), fine-grained RBAC, and real-time token validation – security down to the WebSocket protocol layer, not just the API.

Education

- B.S. in Software Engineering
National University of Skill Dezful, since October 2026
- Associate Degree in Software Engineering
National University of Skill Dezful, October 2024 – June 2026

Currently Learning

- Kubernetes (Cloud-Native & Orchestration)
- Blazor SSR (Interactive Server-Side Rendering)
